## Background

This gene encodes a type III intermediate filament protein. Intermediate filaments, along with microtubules and actin microfilaments, make up the cytoskeleton. The encoded protein is responsible for maintaining cell shape and integrity of the cytoplasm, and stabilizing cytoskeletal interactions. This protein is involved in neuritogenesis and cholesterol transport and functions as an organizer of a number of other critical proteins involved in cell attachment, migration, and signaling. Bacterial and viral pathogens have been shown to attach to this protein on the host cell surface. Mutations in this gene are associated with congenital cataracts in human patients.

Validation Data

Immunoprecipitation analysis of 300 µg extracts of Jurkat cells using 3 µg Vimentin antibody (A19607). Western blot was performed from the immunoprecipitate using Vimentin antibody (A19607) at a dilution of 1:1000.

Western blot analysis of lysates from wild type (WT) and Vimentin knockout (KO) 293T cells, using [KO Validated] Vimentin Rabbit mAb (A19607) at 1:1000 dilution. Secondary antibody: HRP Goat Anti-Rabbit IgG (H+L) (AS014) at 1:10000 dilution. Lysates/proteins: 25µg per lane. Blocking buffer: 3% nonfat dry milk in TBST. Detection: ECL Basic Kit (RM00020). Exposure time: 1s.
