Background

Histones are basic nuclear proteins that are responsible for the nucleosome structure of the chromosomal fiber in eukaryotes. Nucleosomes consist of approximately 146 bp of DNA wrapped around a histone octamer composed of pairs of each of the four core histones (H2A, H2B, H3, and H4). The chromatin fiber is further compacted through the interaction of a linker histone, H1, with the DNA between the nucleosomes to form higher order chromatin structures. This gene is intronless and encodes a replication-dependent histone that is a member of the histone H3 family. Transcripts from this gene lack polyA tails; instead, they contain a palindromic termination element. This gene is located separately from the other H3 genes that are in the histone gene cluster on chromosome 6p22-p21.3.

Validation Data

Immunoprecipitation of DiMethyl-Histone H3-K4 from 600 µg extracts of HeLa cells was performed using 3 µg of DiMethyl-Histone H3-K4 Rabbit mAb (A22143). Rabbit Control IgG (AC005) was used to precipitate the Control IgG sample. IP samples were eluted with 1X Laemmli Buffer. The Input lane represents 10% of the total input. Western blot analysis of immunoprecipitates was conducted using DiMethyl-Histone H3-K4 Rabbit mAb (A22143) at a dilution of 1:10000.

Western blot analysis of various lysates using DiMethyl-Histone H3-K4 Rabbit mAb (A22143) at 1:3000 dilution incubated overnight at 4°C. Secondary antibody: HRP-conjugated Goat anti-Rabbit IgG (H+L) (AS014) at 1:10000 dilution. Lysates/proteins: 25 µg per lane. Blocking buffer: 3% nonfat dry milk in TBST. Detection: ECL Basic Kit (RM00020). Negative control (NC): H3 protein. Exposure time: 30 s.

Chromatin immunoprecipitation was performed with 10 µg of cross-linked chromatin from HeLa using 5 µg of DiMethyl-Histone H3-K4 Rabbit mAb [A22143]. DNA libraries were prepared using Scale ssDNA-seq Lib Prep Kit for Illumina V2 (RK20228). The ChIP sequencing results indicate the enrichment pattern of DiMethyl-Histone H3-K4 in the representative genomic region surrounding GAPDH gene.

The ChIP sequencing results indicate the enrichment pattern of DiMethyl-Histone H3-K4 across chromosome 12 (upper panel) and the genomic region encompassing GAPDH, a representative gene enriched in DiMethyl-Histone H3-K4 (lower panel).

Chromatin immunoprecipitation analysis of extracts of HeLa cells, using DiMethyl-Histone H3-K4 Rabbit mAb (A22295) and rabbit IgG. The amount of immunoprecipitated DNA was checked by quantitative PCR. Histogram was constructed by the ratios of the immunoprecipitated DNA to the input.

Validation Data

CUT&Tag was performed using the CUT&Tag Assay Kit (pAG-Tn5) for Illumina (RK20265) from 10^5 HeLa with 1 μ g of DiMethyl-Histone H3-K4 Rabbit mAb (A22143), followed by incubation with Goat Anti-Rabbit IgG(H+L)(AS070).
