Background

Puromycin is an aminonucleoside antibiotic, derived from the Streptomyces alboniger bacterium, that causes premature chain termination during translation taking place in the ribosome. It has a role as a nucleoside antibiotic, an antiinfective agent, an antineoplastic agent, a protein synthesis inhibitor, an antimicrobial agent, an EC 3.4.11.14 (cytosol alanyl aminopeptidase) inhibitor and an EC 3.4.14.2 (dipeptidyl-peptidase II) inhibitor. It is a conjugate base of a puromycin(1+).Puromycin is an antibiotic that prevents bacterial protein translation. It is utilized as a selective agent in laboratory cell cultures. Puromycin is toxic to both prokaryotic and eukaryotic cells, resulting in significant cell death at appropriate doses.

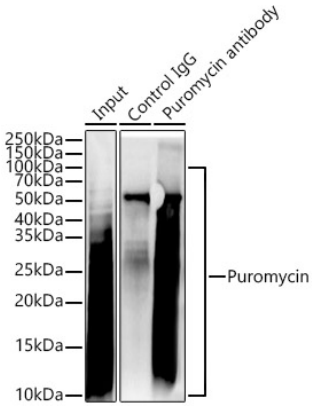
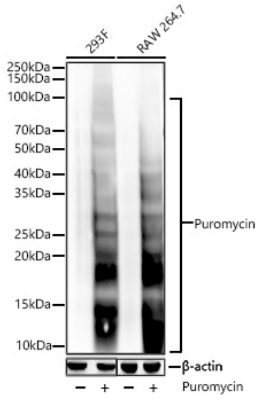
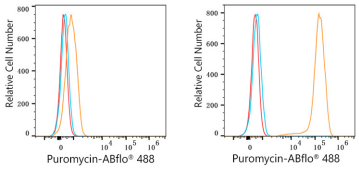
Validation Data



Immunoprecipitation analysis of 300ug extracts of 293T+puromycin cells using 3ug puromycin antibody (A23031). Western blot was performed from the immunoprecipitate using puromycin antibody (A23031) at a dilution of 1:5000.



Western blot analysis of various lysates using Puromycin Rabbit mAb (A23031) at 1:8000 dilution incubated overnight at 4℃. 293F and Raw 264.7 cells were treated with puromycin (20 μg/mL) at 37℃ for 4 hours.
Secondary antibody: HRP-conjugated Goat anti-Rabbit IgG (H+L) (AS014) at 1:10000 dilution.
Lysates/proteins: 30 μg per lane.
Blocking buffer: 3% nonfat dry milk in TBST.
Detection: ECL Basic Kit (RM00020).
Exposure time: 60s.



Flow cytometry:1X10^6 293T cells (negative control,left) and 293T cells(treated with puromycin,right) were intracellularly-stained with puromycin Rabbit mAb(A23031,2 μg/mL,orange line) or ABflo® 488 Rabbit IgG isotype control (A22069,2 μg/mL,blue line). Non-fluorescently stained cells was used as blank control (red line).
