## Background

The protein encoded by this gene is a surface antigen that is preferentially expressed on monocytes/macrophages. It cooperates with other proteins to mediate the innate immune response to bacterial lipopolysaccharide, and to viruses. This gene has been identified as a target candidate in the treatment of SARS-CoV-2-infected patients to potentially lessen or inhibit a severe inflammatory response. Alternative splicing results in multiple transcript variants encoding the same protein.

Flow cytometry: 1X10^6 HUVEC cells (negative control,left) and Human PBMC (right) were surface-stained with PE Rabbit anti-Human CD14 mAb (A25938,5 $\mu /$ /Test, orange line) or PE Rabbit IgG isotype control (A24172,5 $\mu$ //Test,blue line). Nonfluorescently stained cells were used as blank control (red line).
