Background

The protein encoded by this gene is a natural cytotoxicity receptor (NCR) that may aid NK cells in the lysis of tumor cells. The encoded protein interacts with CD3-zeta (CD247), a T-cell receptor. A single nucleotide polymorphism in the 5' untranslated region of this gene has been associated with mild malaria susceptibility. Three transcript variants encoding different isoforms have been found for this gene.

Validation Data

Flow cytometry: 1×10^6 293T cells (negative control, left) and 293T (Transfection, right) cells were surface-stained with ABflo® 700 Rabbit anti-Human CD337/NKp30 mAb (A26577,5 μ l/Test, orange line) or ABflo® 700 Rabbit IgG isotype control (A25976,5 μ l/Test, blue line). Non-fluorescently stained cells were used as blank control (red line).
