## Background

Protein tags are peptide sequences genetically grafted onto a recombinant protein. Often these tags are removable by chemical agents or by enzymatic means, such as proteolysis or intein splicing. Tags are attached to proteins for various purposes. Epitope tags are short peptide sequences which are chosen because high-affinity antibodies can be reliably produced in many different species. These are usually derived from viral genes, which explain their high immunoreactivity. Epitope tags include V5-tag, Myc-tag, HA-tag and NE-tag. These tags are particularly useful for western blotting, immunofluorescence and immunoprecipitation experiments, although they also find use in antibody purification.

## Validation Data

Immunoprecipitation analysis of 300 µg extracts of 293T-NLK-Myc cells using 3 µg Myc-Tag antibody (AE009). Western blot was performed from the immunoprecipitate using Myc-Tag antibody (AE009) at a dilution of 1:20000.

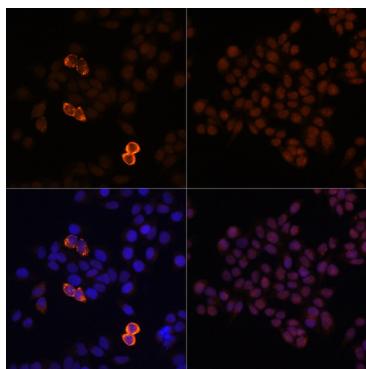

Western blot analysis of extracts of normal 293T cells and 293T transfected with Myc-NLK protein, using Rabbit anti Myc-Tag pAb (AE009) at 1:5000 dilution.  
Secondary antibody: HRP-conjugated Goat anti-Rabbit IgG (H+L) (AS014) at 1:10000 dilution.  
Lysates/proteins: 25µg per lane.  
Blocking buffer: 3% nonfat dry milk in TBST.  
Detection: ECL Basic Kit (RM00020).  
Exposure time: 10s.
