## Background

Mouse IL-17A is an approximately 40 kDa, secreted, disulfide-linked heterodimeric glycoprotein comprised of two members of the IL-17 family of cytokines, IL-17A and IL-17F. Members of this family demonstrate a structural motif termed a cysteine knot that also characterizes a large superfamily of growth factors. Although most cysteine knot superfamily members use three intrachain disulfide bonds to create a knot, IL-17 family molecules generate the same structural form with only two disulfide links. Mouse IL-17A is synthesized as a 158 amino acid (aa) precursor that contains a 25 aa signal sequence and a 133 aa mature chain. The mature chain contains one potential site for N-linked glycosylation. Mouse IL-17F is synthesized as a 161 aa precursor with a 29 aa signal sequence and a 132 aa mature chain. Like IL-17A, the mature chain of IL-17F contains one potential site for N-linked glycosylation. IL-17A and IL-17F share 50% aa sequence homology and are syntenic, both located at the A4 region of mouse chromosome 1. Mouse IL-17A and IL-1...
